

LinHES - Bug # 142: Lossless Transcode Swaps Audio Channels

Status:	Closed	Priority:	Normal
Author:	mihanson	Category:

Updated:	02/27/2009	Due date:	
Description:	I performed a lossless transcode on 3 different OTA HDTV recordings (PBS, CBS and ABC) and in each case the audio tracks were swapped in the process. Audio track 1 became audio track 2 and audio track 2 became audio track 1. I'm unaware if this is LinHES specific or a MythTV problem. I can find people talking about it with regard to UK DVB-T recordings on gossamer threads, but not for ATSC OTA HDTV. (Although both are treated as DVB I suppose.)

While MythTV does get a few patches, there is nothing patch that should affect it's inter workings. Can you find more details?

01/22/2009 04:46 pm - mihanson

Unfortunately, I have no logs to look back on (See item #138 and #143), so I'll have to try to reproduce the problem and look at the logs.

After an upgrade last night this issue seems to have become more intermittant. I did a lossless transcode on 2 shows from Fox and got 1 of 2 correct. :shrug: Nothing out of the ordinary in the logs. I vaguely recall that this may have something to do with your program guide language selection in Setup -> Appearance -> 4th screen (localization). I have English/Spanish for my guide language #1 and #2 respectively. I'm going to change it to English/English and see if that makes a difference in the future. I'll get back to this ticket as soon as I'm able to do more testing.

So far English/English in the guide language seems to have no effect on the channel swapping. I'd say if multiple audio channels are present, 75% of the time it swaps them. I even saw a few instances of the video track being moved from #0.0 to #0.1. Strange behavior. In case anyone else needs to fix this type of thing here's a workaround: `<code>mythtv$: ffmpeg -i /path/to/bad/file</code>` note what audio (or in some cases video) channel needs to be moved. Then `<code>mythtv$: ffmpeg -i /path/to/bad/file -vcodec copy -map 0:0 -acodec copy -map 0:2 /path/to/corrected/new/file</code>` The -map parameter determines what a/v stream goes where. The new file will only have one audio track, presumably the one you want to hear. ;) Look at the ffmpeg man page if you need help.

This has been going on for years for us uk dvb-t users, lossless encoding seems to pik the first stream it finds in the file rather than the lowest pid.
